VCI Sales Dashboard

Quick User Guide

Version 1.0 — Initial Production Release / Working Baseline
Internal Use Only

Purpose

The **VCI Sales Dashboard** provides leadership with a centralized view of current unbilled sales exposure and available billed sales activity.

The dashboard is organized into two complementary analytical pages:

Page 1 — Unbilled Sales Analysis focuses on current unbilled sales exposure, aging, project and Division concentration, and conditions requiring operational attention.

Page 2 — Billed Sales Analysis focuses on billed sales volume, time from work performed to billing, billing-cycle concentration, and potential billing delays.

Together, the pages help leadership move from:

What remains unbilled?

to:

What has reached billing?

and:

How efficiently is completed work moving through the billing cycle?

The dashboard is intended to support leadership review, operational prioritization, billing follow-up, and project-level investigation.

It should be used as a decision-support tool rather than as a replacement for accounting, project-management, billing, or operational context.

Dashboard Reporting Context

Version 1.0 analyzes the sales records currently available within the loaded source files.

The dashboard is **not intended to represent all historical VCI billed and unbilled sales**.

Because the available billed and unbilled datasets cover different source periods, each page includes a **Data Coverage** indicator so users can understand which dates are represented before comparing results.

Unbilled Sales

The Unbilled Sales page displays the range of **Work Performed Dates** represented in the currently loaded unbilled dataset.

At the current Version 1.0 refresh, the dashboard displays:

Unbilled Work Date Coverage: Mar 17, 2025 – Aug 13, 2026

Billed Sales

The Billed Sales page displays the range of **Invoice Export Dates** represented in the currently loaded billed dataset.

At the current Version 1.0 refresh, the dashboard displays:

Invoice Data Coverage: Aug 12, 2026 – Aug 13, 2026

These date ranges should always be reviewed before interpreting or comparing billed and unbilled totals.

The coverage cards update as the underlying source files change.

Primary Leadership Aging Framework

Leadership's primary management lens is:

60 Days or Less

versus

Over 60 Days

This framework is used differently on the two pages.

Unbilled Sales

For unbilled sales, aging represents how long completed work has remained unbilled.

The primary leadership question is:

How much current unbilled exposure has remained unbilled beyond 60 days?

Billed Sales

For billed sales, aging represents the number of days between:

Work Performed Date → Invoice Export Date

The primary leadership question is:

How much billed sales reached billing within 60 days versus requiring more than 60 days?

Detailed 90+ and 101+ aging remains available for additional escalation analysis, but the 60-day threshold is the primary management framework.

Getting Started

Before reviewing results, confirm the **Last Refresh** timestamp and the applicable **Data Coverage** shown on the page.

Begin with the **Executive Snapshot** to understand the overall sales position. Then review the **Executive Alerts**, followed by the aging or billing-cycle distribution, Project and Division concentration, and finally the detailed matrix when deeper investigation is required.

Use the page navigation buttons labeled:

Unbilled Sales Analysis

and

Billed Sales Analysis

to move between the two analytical views.

Dashboard Filters

Both pages use common analytical filters so leadership can investigate the same business population across billed and unbilled sales.

Available filters include:

- **Division**
- **Project**
- **Aging Bucket**

Selections affect applicable KPIs, charts, executive alerts, and detail tables.

Because billed and unbilled aging represent different business conditions, the same Aging Bucket selection should be interpreted according to the page being reviewed.

For example, selecting **61–70 Days Aged** means:

On the **Unbilled page:** work that has currently remained unbilled for 61–70 days.

On the **Billed page:** work that required 61–70 days to move from Work Performed Date to Invoice Export Date.

Division

The **Division** slicer limits applicable dashboard results to the selected Division.

Use it to investigate sales exposure, billing activity, aging, Project concentration, and executive alerts within a specific operating area.

Because the dashboard uses a common Project and Division framework, Division selections can provide consistent context across both Billed and Unbilled Sales pages.

Project

The **Project** slicer limits applicable dashboard results to the selected Project.

Use this filter when leadership wants to investigate a specific job's:

- Total unbilled sales
- Total billed sales
- Aging profile
- Billing-cycle timing
- Over-60 exposure
- Supporting detail

Aging Bucket

The **Aging Bucket** slicer allows users to isolate a specific aging or billing-cycle stage.

Current buckets include:

- 0–30 Days Aged
- 31–50 Days Aged
- 51–60 Days Aged
- 61–70 Days Aged
- 71–80 Days Aged
- 81–90 Days Aged
- 91–100 Days Aged
- 101+ Days Aged
- Unclassified

Use the bucket slicer for deeper investigation after first reviewing the broader **60 Days or Less vs. Over 60 Days** management view.

Clear All Slicers

Use **Clear all slicers** to remove active selections and return the dashboard to its default enterprise view.

This is particularly useful when moving between broad leadership review and Project-specific investigation.

Always confirm slicer state before interpreting organization-wide totals.

Page 1 — Unbilled Sales Analysis

Page Purpose

The **Unbilled Sales Analysis** page provides leadership with visibility into current unbilled sales exposure, how long the underlying work has remained unbilled, where balances are concentrated, and which conditions may require follow-up.

The page is organized around the question:

Unbilled Sales Analysis — Where is unbilled sales concentrated, how long has it remained unbilled, and what requires operational attention?

Unbilled Executive Snapshot

Business Question

What is the current scale and aging risk of our unbilled sales exposure?

The Executive Snapshot combines unbilled exposure with selected billed-sales context so leadership can understand both the outstanding balance and the portion of the currently loaded sales population that has reached billing.

Total Unbilled Sales

Shows the total dollar amount currently represented as unbilled within the applicable dashboard context.

This is the primary financial-exposure measure on Page 1.

% Unbilled Sales of Total Sales

Shows the share of the currently loaded combined sales population represented by Unbilled Sales.

Conceptually:

Total Unbilled Sales ÷ (Total Unbilled Sales + Total Billed Sales)

This provides additional context for the relationship between currently loaded billed and unbilled sales.

Because the Billed and Unbilled source datasets may represent different date coverage, this percentage should always be interpreted together with the Data Coverage indicators.

Total Billed Sales

Provides a quick reference to Billed Sales from the currently loaded billed dataset.

This KPI is included on the Unbilled page so leadership can compare current Unbilled Sales with available Billed Sales without leaving the page.

It should not be interpreted as all historical VCI billed sales.

% Billed Sales of Total Sales

Shows the Billed Sales share of the currently loaded combined sales population.

Conceptually:

Total Billed Sales ÷ (Total Billed Sales + Total Unbilled Sales)

The Billed and Unbilled percentages should reconcile to approximately 100% within the same filter context.

Unbilled Project Count

Shows the number of distinct Projects currently contributing to Unbilled Sales.

Use this with Total Unbilled Sales to determine whether exposure is broadly distributed or concentrated across relatively few Projects.

Unbilled Over 60 Days

Shows the dollar amount of current Unbilled Sales that has aged beyond 60 days.

This is one of the primary leadership measures on Page 1.

% Unbilled Over 60 Days

Shows the percentage of current Unbilled Sales that has aged beyond 60 days.

Conceptually:

Unbilled Over 60 Days ÷ Total Unbilled Sales

This is the primary aging-exposure percentage for leadership review.

Unbilled Over 90 Days

Shows the dollar amount of current Unbilled Sales aged beyond 90 days.

This provides secondary escalation context within the broader Over-60 population.

% Unbilled Over 90 Days

Shows the percentage of Total Unbilled Sales aged beyond 90 days.

Use this as supporting escalation information rather than as the primary management threshold.

Average Aging Days

Shows the average number of days represented by the current Unbilled Sales population.

Use this with the detailed aging distribution and Over-60 measures rather than interpreting it by itself.

Executive Unbilled Sales Alerts

Purpose

The **Executive Unbilled Sales Alerts** section highlights material aging, Project, and concentration conditions requiring leadership attention.

The alerts are intended to answer:

What current unbilled sales conditions require leadership attention?

Current alert types include:

Over-60 Exposure — highlights when a material share of current Unbilled Sales has aged beyond 60 days.

Project Aging — identifies a Project carrying significant Unbilled Sales over 60 days.

Division Concentration — highlights when a significant share of total Unbilled Sales is concentrated within one Division.

Stale Balance — flags unusually old Unbilled Sales activity that may warrant escalation or review.

Alerts are prioritization tools.

They identify where investigation may be useful but do not establish the underlying cause or indicate poor Project or Division performance.

Executive Alert Definitions

The **Executive Alert Definitions** table explains the working conditions represented by each Unbilled Sales alert.

Current definitions are displayed directly on the dashboard so users can understand why an alert may appear.

Alert thresholds remain **working management references** and may be adjusted as leadership establishes more representative operating ranges.

Total Unbilled Sales by Aging Bucket

Business Question

How much unbilled sales exposure is concentrated in each aging stage?

This chart distributes current Unbilled Sales across the detailed aging buckets.

For leadership review, first group the buckets conceptually into:

60 Days or Less:
0–30, 31–50, and 51–60 days.

Over 60 Days:
61–70, 71–80, 81–90, 91–100, and 101+ days.

Use the detailed buckets to understand where the Over-60 exposure is accumulating.

Total Unbilled Sales by Project

Business Question

Which projects are driving the largest unbilled balances?

This visual ranks Projects by current Unbilled Sales and shows how those balances are distributed across aging buckets.

A large Project balance does not automatically represent a concern.

Review both:

Dollar amount + Aging composition

before determining whether follow-up is needed.

Total Unbilled Sales by Division

Business Question

Which divisions carry the greatest unbilled sales exposure?

This chart shows Unbilled Sales by Division and displays the aging composition within each Division.

Use it to identify organizational concentration before drilling into individual Projects.

A larger Division may naturally carry more Unbilled Sales because of its operating scale.

Unbilled Sales Details Matrix

Business Question

Which projects require the greatest attention based on both unbilled balance and aging?

The detail matrix provides the primary investigative view for Unbilled Sales.

Users can move through available Project detail while viewing amounts across:

0–30 | 31–50 | 51–60 | 61–70 | 71–80 | 81–90 | 91–100 | 101+ | Unclassified | Total

Use the matrix to move from:

Enterprise signal → Division → Project → Project detail

Conditional formatting helps make larger or more concentrated balances easier to identify.

Formatting should be used as a visual prioritization aid rather than as a performance judgment.

Unbilled Work Date Coverage

The **Unbilled Work Date Coverage** indicator shows the earliest and latest Work Performed Dates represented in the currently loaded Unbilled Sales dataset.

This is important because the dashboard represents the available unbilled population rather than a complete historical sales archive.

Always review this coverage before comparing Unbilled Sales with another report or with Billed Sales.

Page 2 — Billed Sales Analysis

Page Purpose

The **Billed Sales Analysis** page provides leadership with visibility into available billed sales activity and the amount of time completed work required to reach billing.

The page is organized around the question:

Billed Sales Analysis - How effectively is completed work converting into billed sales, and where are billing delays or concentrations emerging?

The primary Page 2 management framework is:

Billed Within 60 Days

versus

Billed Over 60 Days

Billed Executive Snapshot

Business Question

What is the current scale and billing-cycle performance of billed sales?

The Executive Snapshot combines Billed Sales performance with selected Unbilled Sales context.

Total Billed Sales

Shows the total billed amount represented in the currently loaded Billed Sales dataset.

Always interpret this KPI together with the **Invoice Data Coverage** indicator.

It should not be interpreted as all historical VCI billed sales.

% Billed Sales of Total Sales

Shows Billed Sales as a percentage of the currently loaded Billed + Unbilled Sales population.

This provides quick cross-page context but should be interpreted within the different source-date coverage of the two datasets.

Total Unbilled Sales

Provides current Unbilled Sales exposure as a reference KPI on the Billed Sales page.

This allows leadership to compare currently available Billed Sales activity with outstanding Unbilled Sales without navigating back to Page 1.

% Unbilled Sales of Total Sales

Shows the Unbilled share of the currently loaded combined Billed and Unbilled Sales population.

The Billed and Unbilled percentages should reconcile to approximately 100% within the same applicable filter context.

Billed Projects

Shows the number of distinct Projects represented in the currently loaded Billed Sales dataset.

Use this with Total Billed Sales to understand the scale and concentration of billing activity.

Billed Invoices

Shows the number of distinct invoices represented within the Billed Sales source population.

This provides context for current billing activity volume.

Billed Within 60 Days

Shows the dollar amount of Billed Sales where the time from Work Performed Date to Invoice Export Date was **60 days or less**.

This is a primary Page 2 management measure.

% Billed Within 60 Days

Shows the percentage of Total Billed Sales that reached billing within 60 days.

Conceptually:

Billed Within 60 Days ÷ Total Billed Sales

A higher percentage indicates that more of the represented billed dollars moved through the billing cycle within the 60-day management window.

Billed Over 60 Days

Shows the dollar amount of Billed Sales where more than 60 days elapsed between Work Performed Date and Invoice Export Date.

This identifies completed work that experienced a longer billing cycle.

% Billed Over 60 Days

Shows the percentage of Total Billed Sales that required more than 60 days to reach billing.

This is the primary exception percentage for Page 2.

Weighted Average Aging Days

Provides Unbilled Sales aging context alongside the Billed Sales metrics.

This allows leadership to compare the age of currently unbilled exposure with the time historically required for the available billed population to reach billing.

Weighted Average Billing Days

Shows the dollar-weighted average number of days between Work Performed Date and Invoice Export Date for applicable Billed Sales.

Larger billed amounts therefore contribute more heavily to the result than smaller amounts.

Use this together with:

- % Billed Within 60 Days
- % Billed Over 60 Days
- Billing Cycle Bucket distribution
- Project and Division results

Executive Billed Sales Alerts

Purpose

The **Executive Billed Sales Alerts** section highlights material billing-cycle, Project, and concentration conditions requiring leadership attention.

Current alert types include:

Over-60 Billing Cycle — highlights when a material share of Billed Sales required more than 60 days to reach billing.

Project Billing Delay — identifies a Project carrying a significant amount of Billed Sales that required more than 60 days to reach billing.

Division Concentration — highlights when a significant share of Total Billed Sales is concentrated within one Division.

Extended Billing Cycle — flags unusually long billing-cycle activity that may warrant additional operational review.

The presence of an alert indicates a condition requiring context and investigation.

It does not by itself establish that a Project, Division, or process is performing poorly.

Billed Executive Alert Definitions

The **Executive Alert Definitions** table explains the working conditions represented by each Billed Sales alert.

Current alert thresholds are intended as management reference points during the Version 1.0 working-baseline period.

Leadership may adjust these thresholds after reviewing additional billing cycles and establishing normal operating ranges.

Total Billed Sales by Aging Bucket

Business Question

How quickly is completed work being converted into billed sales?

On Page 2, the Aging Bucket represents **billing-cycle duration**.

For each record:

Billing Cycle Days = Invoice Export Date − Work Performed Date

The visual therefore shows how much Billed Sales reached billing within each time interval.

For primary leadership review, interpret the buckets as:

Within 60 Days:
0–30, 31–50, and 51–60 days.

Over 60 Days:
61–70, 71–80, 81–90, 91–100, and 101+ days.

Unclassified Billed Aging

The Billed Sales page currently contains an **Unclassified** billing-cycle population.

This represents Billed Sales records that cannot currently be assigned to a standard billing-cycle bucket under the available date logic.

Possible reasons may include missing or invalid Work Performed Date or Invoice Export Date information.

The Unclassified category remains visible intentionally so incomplete source records are not silently removed from Total Billed Sales.

A material Unclassified balance should therefore be considered when interpreting Billed Sales timing metrics.

Total Billed Sales by Project

Business Question

Which projects are driving the largest billed sales amounts?

This chart shows Billed Sales by Project and separates the represented amount into:

Billed Within 60 Days

and

Billed Over 60 Days

This allows leadership to distinguish between Projects generating high billed volume efficiently and Projects where a larger share of billed sales required more than 60 days to reach billing.

A large total does not automatically represent a billing issue.

Review the Within-60 and Over-60 composition together.

Total Billed Sales by Division

Business Question

Which divisions are generating the greatest billed sales volume?

This chart shows Total Billed Sales by Division, separated into:

Billed Within 60 Days

and

Billed Over 60 Days

Use it to understand both billing volume and billing-cycle timing across organizational areas.

A high Billed Sales amount is not inherently favorable or unfavorable without considering operating scale and the corresponding time-to-billing distribution.

Billed Sales Details Matrix

Business Question

Which projects require the greatest review based on billed amount and time to billing?

The **Billed Sales Details Matrix** provides detailed visibility into the billed amounts contributing to each billing-cycle bucket.

The matrix displays:

0–30 | 31–50 | 51–60 | 61–70 | 71–80 | 81–90 | 91–100 | 101+ | Unclassified | Total

Use this table when an executive alert, Project chart, Division chart, or billing-cycle result requires deeper investigation.

The matrix allows users to move from:

Enterprise billing signal → Division → Project → detailed billing activity

---

Invoice Data Coverage

The **Invoice Data Coverage** indicator shows the earliest and latest Invoice Export Dates represented in the currently loaded Billed Sales dataset.

At the current Version 1.0 refresh, the available invoice-date coverage is:

Aug 12, 2026 – Aug 13, 2026

This is a critical interpretation point.

The Billed Sales page currently represents a limited billing-data period and should **not** be interpreted as a complete historical view of all VCI invoices or billed sales.

As additional billed sales files are loaded, the coverage indicator and corresponding Billed Sales metrics will update.

Understanding Billed vs. Unbilled Aging

Although the two pages use common Aging Bucket labels, the underlying business meaning is different.

Unbilled Sales Aging

Answers:

How long has this completed work remained unbilled?

It represents the age of currently outstanding unbilled activity.

Billed Sales Aging / Billing Cycle

Answers:

How long did this completed work take to reach billing?

It represents the elapsed time between Work Performed Date and Invoice Export Date.

This distinction is important when comparing the same Aging Bucket across the two pages.

Recommended Leadership Review Sequence

For routine sales and billing review, leadership should begin with the Unbilled Sales page and determine the scale of current outstanding exposure.

Review how much is over 60 days, where those dollars are concentrated, and whether Executive Alerts identify a Project, Division, or unusually stale balance requiring attention.

Then move to the Billed Sales page.

Review how much billed activity is represented within the available invoice coverage, how much reached billing within 60 days, and how much required more than 60 days.

Use Project and Division analysis to identify concentrations, then use the detail matrices for operational investigation.

The overall analytical sequence is:

What remains unbilled?

↓

How much has exceeded 60 days?

↓

Where is the exposure concentrated?

↓

What has reached billing?

↓

How quickly did completed work reach billing?

↓

Which Projects or Divisions warrant additional review?

Quick Interpretation Reminders

- **60 days is the primary leadership threshold across both pages.**
- On Page 1, Over 60 Days represents current aging exposure.
- On Page 2, Over 60 Days represents time that completed work required to reach billing.
- Billed and Unbilled aging should not be interpreted as the same event.
- Billed Sales currently represents a limited Invoice Export Date range.
- Always review the Data Coverage indicator before comparing Billed and Unbilled totals.
- % Billed Sales and % Unbilled Sales describe the currently loaded combined sales population, not all historical VCI sales.
- A large sales balance does not automatically indicate a problem.
- Amount and aging should be reviewed together.
- A large Division may naturally have more Billed or Unbilled Sales because of operating scale.
- Executive Alerts identify conditions for investigation; they are not performance ratings.
- 90+ and 101+ aging provide secondary escalation context.
- Unclassified records remain visible so incomplete billing-cycle information is not silently excluded.

- Always check the Last Refresh before using dashboard results for operational or executive decisions.
- Always confirm active slicers before comparing results with another report.

Frequently Asked Questions

Why are Billed Sales much lower than Unbilled Sales?

The two datasets currently represent different source-date coverage.

The current Billed Sales page contains Invoice Export Dates from the period displayed in **Invoice Data Coverage**, while the Unbilled dataset contains a broader range of Work Performed Dates.

The values should therefore not be interpreted as a complete historical billed-versus-unbilled comparison.

What does % Billed Sales of Total Sales mean?

It represents:

Total Billed Sales ÷ (Total Billed Sales + Total Unbilled Sales)

using the currently loaded source populations and applicable filters.

It provides useful directional context but should always be interpreted within the documented Data Coverage of both datasets.

What does % Unbilled Sales of Total Sales mean?

It represents:

Total Unbilled Sales ÷ (Total Billed Sales + Total Unbilled Sales)

within the current reporting context.

Together, % Billed and % Unbilled should reconcile to approximately 100%.

Why is there no historical date slicer?

Version 1.0 is designed primarily around the current loaded Billed and Unbilled Sales populations.

The available source files do not currently provide a complete historical snapshot framework suitable for reconstructing the exact billed or unbilled position at every prior point in time.

Data Coverage indicators are therefore used instead of a historical reporting-period slicer.

What is the difference between Average Aging Days and Weighted Average Billing Days?

Average Aging Days describes the average age of current Unbilled Sales activity.

Weighted Average Billing Days describes how long billed work took to reach billing, with larger billed dollar amounts carrying greater influence in the calculation.

They answer different business questions and should not be interpreted interchangeably.

Why is there an Unclassified category on the Billed Sales page?

Some Billed Sales records may not have enough valid date information to calculate the time between Work Performed Date and Invoice Export Date.

Rather than excluding those dollars, the dashboard retains them as **Unclassified**.

This keeps Total Billed Sales complete while making the missing timing information visible.

Does a Project Billing Delay alert mean the Project performed poorly?

No.

It means a material amount of the represented Project's Billed Sales required more than 60 days to reach billing.

Additional operational context is required to determine why.

Does a Division Concentration alert mean the Division has a problem?

Not necessarily.

A large Division may naturally represent a larger share of enterprise sales activity.

The alert identifies concentration so leadership knows where additional review may provide value.

Why can Executive Alerts change when I use slicers?

Executive Alerts respond to the applicable dashboard filter context.

Changing Division, Project, or Aging Bucket may change which conditions meet configured alert thresholds.

This behavior is intentional.

Why might Power BI differ from another sales or billing report?

Possible reasons include:

- Different source-file dates
- Different refresh timestamps
- Different Invoice Export Date coverage
- Different Work Performed Date coverage
- Active dashboard filters
- New billing activity
- Corrections or reconciliations
- Incomplete or unmatched source information

Before comparing reports, confirm the source population, date coverage, Last Refresh, and slicer state.

What should I do if a number looks unusual?

First review:

Last Refresh

then:

Data Coverage

then:

Division, Project, and Aging Bucket slicers

Use **Clear all slicers** if necessary.

Then review the applicable Project or Division chart and use the detailed matrix to identify the underlying records.

Best Practices

Begin at the enterprise level before applying filters.

Use the 60-day threshold as the primary management lens before drilling into individual aging buckets.

Review amount and aging together rather than prioritizing solely based on the largest balance.

Use Executive Alerts as a starting point for investigation rather than as a final judgment.

When comparing Billed and Unbilled Sales, always review the applicable Data Coverage because the current source populations are not historically equivalent.

Use the detail matrices to validate executive-level findings before drawing conclusions.

Document recurring billing-cycle patterns, unusually aged Projects, source-data gaps, and threshold questions during the working-baseline period.

Working Threshold Guidance

The Executive Alert thresholds used in Version 1.0 are **working management references**.

They are intended to support leadership prioritization while the organization establishes more representative operating ranges.

As additional Billed and Unbilled Sales data becomes available, leadership should review whether the current thresholds:

- Identify meaningful conditions
- Appropriately emphasize the 60-day management threshold
- Produce a useful number of alerts
- Reflect normal operating patterns
- Support actionable follow-up

Thresholds may be revised as the reporting framework matures.

Changing a threshold does not mean previous dashboard results were incorrect.

It reflects refinement of the management framework based on additional organizational evidence.

Support and Feedback

During the Version 1.0 working-baseline period, users are encouraged to document questions regarding metric definitions, unexpected balances, billing-cycle patterns, Projects requiring additional context, alert thresholds, missing dates, Unclassified records, source-data discrepancies, Data Coverage limitations, or additional business questions.

Feedback will help improve the analytical framework, strengthen data quality, establish more representative management thresholds, and guide future dashboard versions.

Final Reminder

The **VCI Sales Dashboard** is designed to provide a connected view of the sales and billing lifecycle:

What remains unbilled?

↓

How long has it remained unbilled?

↓

Where is the exposure concentrated?

↓

What has reached billing?

↓

How quickly is completed work reaching billing?

↓

Which conditions require leadership or operational attention?

The dashboard should support faster, more consistent leadership conversations while preserving the Project, billing, and operational context required for appropriate follow-up.

VCI Construction Business Intelligence Platform
Sales Dashboard | Version 1.0 | Working Baseline | Internal Use Only
