Executive HR Dashboard v2.0

Data Source & Connection Summary

Version: 2.0 Proof of Concept
Date: August 24, 2026
Use: Internal Review

Purpose

This document provides an overview of the data sources and connection structure supporting the Executive HR Dashboard v2.0 PBIX file. It is intended to give Dycom visibility into where the dashboard data originates, how it is processed, and what is required to keep the report current.

Current Data Architecture

The PBIX imports approved VCI HR workforce data from the existing Smartsheet-synchronized reporting environment and supporting operational workforce files.

Power Query is used to connect to, combine, clean, and standardize the source data. DAX is used within the PBIX to create governed measures, calculated fields, reporting periods, alerts, and analytical classifications.

Because the workforce data is imported into the PBIX, a Power BI refresh is required for changes in the underlying sources to appear in the dashboard.

Workforce Data Sources

The workforce sources feeding or supporting the model include:

- **Workforce Master** — Governed workforce dataset used for employee population, workforce status, organizational attributes, hiring, separation, retention, and workforce movement analysis.
- **VCI Active Employee Report** — Supports validation and maintenance of the active workforce population.
- **VCI Separation Employee Report** — Supports separation, turnover, retention, and termination analysis.
- **VCI LOA Employee Report** — Supports leave-of-absence population and workforce-capacity analysis.
- **Employee Provisioning** — Supports employee and organizational attribute validation where applicable.

- **Smartsheet-Synchronized HR Data** — Provides the current operational reporting environment from which approved workforce information is maintained and refreshed.

Historical workforce records may include information originating from earlier paper-based processes, UKG, and the current SAP environment. These represent historical source context and are not necessarily separate live PBIX connections.

Governed Model Components

The PBIX also contains locally governed model components, including:

- Calendar and reporting-period dimensions
- Workforce group and organizational classifications
- Retention and tenure classifications
- Talent Acquisition measures
- Turnover and replacement-cost estimates
- Executive alert logic
- DAX measures and calculation tables
- Supporting QA and reconciliation measures

These components are created within the Power BI model and do not represent separate external data-source connections.

Authoritative Workforce Status

`Workforce Master[Workforce Status]` is the authoritative workforce-status field used throughout the dashboard.

The governed workforce-status values are:

- Active
- LOA
- Separated

Refresh and Access Requirements

- The PBIX must be refreshed to retrieve the latest imported workforce data.
- The person refreshing the report must have access to the connected VCI source environment.
- Source credentials, privacy settings, and any gateway requirements must remain valid.
- Source file names, locations, schemas, and required columns should be validated before broader distribution.
- Exact connection paths and credential settings can be reviewed within the PBIX data-source and Power Query settings.

Validation Expectations

Before the PBIX is distributed or published, the following should be confirmed:

- All required sources are accessible.
- The report refresh completes successfully.
- Expected source columns remain available.
- Workforce row counts and distinct employee counts are reasonable.
- Blank and duplicate employee identifiers are reviewed.
- Model relationships remain valid.
- Organizational slicers continue to filter the appropriate measures.
- Executive totals reconcile with supporting detail.
- Data-source ownership and refresh responsibility are confirmed.

Security and Distribution

The dashboard contains internal workforce information and should only be distributed to authorized users. PBIX distribution, publishing, source access, and refresh configuration should follow Dycom's established governance and reporting standards.
